

Solution Requirements

Date	29 September 2026
Team ID	SWTID-2026-3838
Project Name	LegalEase: AI-Powered Legal Document Generator
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	The system allows authorized users to access the LegalEase-AI document generation system securely.	High
2	Authorization levels	The system provides appropriate access to users and restricts administrative or system-management functions to authorized users.	Medium
3	External interfaces	The system connects the Streamlit frontend with the FastAPI backend and Gemini AI service for processing user requirements and generating documents.	High
4	Transactions processing	The system accepts legal requirements and user-provided information, processes the request through the backend, sends relevant information to the AI service, and returns the generated legal document.	High

5	Reporting	The system generates the requested legal document and allows the generated content to be viewed, edited, and exported for further use.	High
6	Business rules, etc...	The system analyzes the user's requirements, identifies the required document structure, uses appropriate legal templates/document data, and generates the document according to the provided information.	High
7	Compliance to laws or regulations	The system should handle user-provided legal information responsibly and include appropriate limitations that the generated document is AI-generated and should be reviewed before official/legal use.	High
8	Other	The system provides a simple interface for entering requirements and obtaining a generated legal document without requiring advanced technical knowledge from the user.	Medium

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	The system should process user requests and display the generated document within a reasonable time.	Normal requests should receive a response within an acceptable processing time, depending on AI service response.
2	Scalability	The system should support an increasing number of users and document-generation requests without major changes to the system architecture.	Backend should be capable of handling multiple requests with appropriate resource allocation.
3	Security & Data Privacy	User-provided legal information and generated documents should be protected from unauthorized access. Communication between system components should be secured.	Secure API communication and controlled access to stored/user data.
4	Reliability & Availability	The system should operate consistently and handle errors such as invalid input, unavailable AI service, or backend failures appropriately.	System should display meaningful error messages and avoid application crashes during expected failures.
5	Usability & Accessibility	The interface should be simple, clear, and easy to use for users who want to generate legal documents.	Users should be able to enter requirements, generate a document, view/edit the output, and export it with minimal steps.
6	Maintainability & Portability	Users should be able to enter requirements, generate a document, view/edit the output, and export it with minimal steps.	Users should be able to enter requirements, generate a document, view/edit the output, and export it with minimal steps.
